# **Basic Immunology**

Suppression of the immune response Suppressor mechanisms of immune functions

> 19<sup>th</sup> lecture April 10<sup>th</sup>, 2024 Zoltán Kellermayer

#### Main steps of the immune response

Recognition Molecular and cellular co-operations Activation **Differentiation and clonal expansion Effector functions Memory formation Suppression** 

#### Factors involved in suppression

1. Antigen as the main regulator

2. Need for costimulation

3. Regulatory T cells

4. Regulation of the humoral immune response Regulatory B cells Antibody feedback Anti-idiotype antibodies

#### 1. Antigen as the main regulator

Activates T and B cells

Antigen nature, dose, location influence the immune response

 $T_H 1 vs T_H 2$ 

Withdrawal/elimination of the antigen stops further activation

#### 1. Antigen as the main regulator: influencing the cytokine balance

# 2. Need for costimulation

A Cell intrinsic inhibitory signaling

> Signal block⇒ inhibition of T cell activation

Blocking and removing B7 on APC

Reduced B7 costimulation ⇒ inhibition of T cell activation CD28: constitutively expressed on T cells CTLA-4: expressed after activation higher affinity towards B7

Fig 15-6

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

## 2. Need for costimulation: Immune checkpoints

Nature Reviews | Cancer

# 3. Regulatory T cells (T<sub>reg</sub>) are CD3<sup>+</sup>CD4<sup>+</sup>CD25<sup>hi</sup>

3. Main functions of regulatory T cells

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc.

Fig 15-7

## 3. Development of induced $T_{reg}$ cells

# 3. $T_{reg}$ suppression mechanisms

#### 3. Inhibitory cytokines secreted by T<sub>regs</sub>

#### **TGF**β (Transforming Growth Factor β)

Inhibits classical (M1) macrophage activation Suppresses neutrophils Promotes  $T_{reg}$  differentiation (but under certain circumstances, also  $T_H 17$ !) Induces IgA isotype switch Promotes local tissue repair

#### IL-10

Inhibits IL-12 production by DCs and macrophages Inhibits expression of co-stimulatory molecules on DCs and macrophages Inhibits expression of class II MHC molecules on DCs and macrophages

3.  $T_{reg}$  overview

#### Phenotype: CD3<sup>+</sup> CD4<sup>+</sup> CD25<sup>+</sup> FoxP3<sup>+</sup>

FoxP3 Mutation: IPEX Syndrome (immune dysregulation, polyendocrinopathy, enteropathy, X-linked)

Origin: Thymus (natural) or periphery (induced)

```
Suppression mechanism:

Cytokine secretion: IL-10, TGFβ

IL-10<sup>-/-</sup> mice: colitis

Blocking costimulation via CTLA-4

IL-2 "consumption" via IL-2Rα (CD25, high-affinity IL-2R)

cytolysis
```

#### 4. B cell suppression

Regulatory B cells (B<sub>reg</sub>)

High levels of antibodies block further B cell activation

IgG + antigen immunocomplex inhibits B cell function by binding to FcγRIIb

(IgM + antigen immunocomplex promotes further B cell activation!)

## 4. Regulatory B cells

#### $B_{reg}$ cells produce IL-10, IL-35, and TGF- $\beta$

Prohibit the expansion of pathogenic T cells and other pro-inflammatory lymphocytes

Promote T<sub>reg</sub> cells

No definitive phenotype identified yet

## 4. Suppression via antibody feedback

FcyRIIb: inhibitory FcR (contains ITIM!

Simultaneous binding of antigen + IgG leads to B cell inhibition

Fig 12-21

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

# 4. Anti-idiotype antibodies

Affinity maturation (somatic hypermutation) leads to formation of new structures capable of inducing an immune response

Antibodies will be directed against the idiotype of the original antibody

## 4. Anti-idiotype network

#### 4. Functions of the anti-idiotype network

Suppression of B and T cells

**Functional memory formation** 

Biological mimicry (insulin – anti-insulin – anti-anti-insulin)

# +1a: Pathological suppression: Myeloid Derived Suppressor Cells (MDSCs)

Tumor microenvironment induces differentiation of MDSCs from various myeloid cells (neutrophils, monocytes, dendritic cells)

MDSCs suppress the anti-tumor immune response, promoting tumor growth

Yin K et al 2020. Front. Oncol. 10:610104. doi: 10.3389/fonc.2020.610104

# +1b: Pathological suppression: Tumors inhibit T cells via immune checkpoint

Tumors express inhibitory molecules that lead to blockade of T cell activation (see slide #7)

Targeting these inhibitors is a promising area of tumor immunotherapy (Nobel Prize for in Physiology or Medicine, 2018, James P Allison and Tasuku Honjo)

# **Basic Immunology**

Regional immunity Mucosa and skin associated immune system

> 20<sup>th</sup> lecture April 10<sup>th</sup>, 2024 Zoltán Kellermayer

#### **Regional immune system**

The collection of *immune cells* and *molecules* with specialized functions at a particular anatomic location

Gastrointestinal tract MALT: Mucosa Associated Lymphoid Tissue

Cutaneous immune system SALT: Skin Associated Lymphoid Tissue

# Two types of body surfaces

Draining secondary lymphoid tissues...

#### Intestinal immune system: introduction

Surface: 200 m<sup>2</sup>

~5x10<sup>10</sup> total lymphocytes (blood: 10<sup>10</sup>)

Huge amount of microbes: 10<sup>14</sup>

Harmless (beneficial) antigens: food + microbiome

Immune system has to find the small number of dangerous pathogens within the large amount of harmless antigens

Delicate balance between tolerance and attack

## Overview of the intestinal immune system

**Special structures** M cells **Migrating APCs** Peyer's patches **IgA** Effector cells: T cells, innate lymphoid cells (ILCs), NK cells, MAIT cells, macrophages, eosinophils, mast cells, granulocytes

Fig 14-1

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

## Lymphoid tissues in the gastrointestinal tract

#### **Organized MALT (O-MALT)**

Antigen recognition, activation of antigen specific lymphocytes, induction of effector and memory cells

"Programmed" lymphoid tissues: develop in utero, in defined locations at defined times

Peyer's patch, Tonsils

"*Inducible*" lymphoid tissues: develop/mature after birth, depending on antigenic stimulus

Cryptopatch - isolated lymphoid follicle spectrum

#### **Diffuse MALT (D-MALT)**

Effector tissue

Memory cells, activated effector cells, plasma cells in a diffuse pattern

# Programmed lymphoid tissues in the gastrointestinal tract: Peyer's patch

SED: Subepithelial dome FAE: Follicle associated epithelium

UM Mörbe et al 2021. Mucosal Immunology 14:793-802

# Programmed lymphoid tissues in the gastrointestinal tract: tonsils

Normal tonsil

#### Inflamed tonsil

# SILT (Solitary intestinal lymphoid tissues): inducible and dynamic components of the MALT

LTi+T cells/B cells/FDCs/GC reaction

# Innate immunity of the intestinal immune system: epithelial cells

#### **Epithelial cells**

Goblet cells: mucus secretion mucus: inner (dense) and outer (less-dense) layer antigen sampling... Paneth cells: anti-microbial peptide secretion (defensins, REGIII) M-cells: antigen transport

...all derived from Intestinal (epithelial) stem cells (ISC)

Epithelial cells express PRRs (TLRs, NLRs) in a tightly regulated manner *PRR ligation can lead either to inflammation (against invading pathogens) or to tolerance (against commensal bacteria)* 

## M cells

# Bacterium M cell M cell

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8<sup>th</sup> edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

(Not antigen presentation!)

# ns from the intestinal lumen to the derlying cells

M cell region

## Goblet cells: not only mucus secretion...

GAP: Goblet cell associated Antigen Passages

Transport of luminal antigens to underlying mononuclear phagocytes

Gustafsson et al. eLife 2021;0:e67292. DOI: https://doi.org/10.7554/eLife.67292

#### Innate immunity of the intestinal immune system

#### **Dendritic cells, Macrophages**

Antigen presentation in mLNs

Usually promote tolerance (IL-10, TGFβ)

DCs: express retinal dehydrogenase  $\rightarrow$  secrete retinoic acid  $\rightarrow$  imprinting of guthoming molecules

#### Innate lymphoid cells

Lymphoid cells, but do not express antigen receptors

Secrete cytokines

- ILC1: NKs + non-cytotoxic ILC1s
- ILC2: immune response against helminths, allergy (IL-5, IL-13)

ILC3: mucosal healing (IL-22), inflammation (IL-17a) (+ LTi cells)

# Innate lymphoid cells (ILCs)

Klose CSN and Artis D (2016) Innate lymphoid cells as regulators of immunity, inflammation and tissue homeostasis. Nature Immunology

## Adaptive humoral immune response in the intestine

IgA is the main antibody in the mucosa

~2g IgA produced per day

Large amounts of TGFβ (produced by epithelial cells and DCs) induce IgA isotype switch Neutralizing immunity: prevents microbes/toxins from binding to/crossing the epithelium Within lymphoid follicles (PP, ILF) and dispersed throughout the lamina propria IgA: dimer, transported across the epithelium via *poly-Ig receptor* (=transcytosis)

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

# IgA is transported across the mucosal epithelial cells

Fig 14-8

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

# Intestinal T cell responses

#### Location

**Dispersed:** 

Intraepithelial lymphocytes: mainly CD8<sup>+</sup> or γδ T cells Lamina propria lymphocytes: mainly CD4<sup>+</sup> effector/memory cells Organized lymphoid tissues: Peyer's patches Isolated lymphoid follicles mainly CD4<sup>+</sup> T cells (Tregs, follicular helper T cells)

#### **Types of T cells**

```
    T<sub>H</sub>17 (~ILC3!)
        produce IL-17, IL-22
        important in immune response against certain (extracellular) pathogenic bacteria

    T<sub>H</sub>2 (~ILC2!)
        produce IL-4, IL-13
        important in immune response against helminths

    Regulatory T cells (Tregs)
        produce TGFβ, IL-10
        important in inducing tolerance against non-pathogenic microbes
```

# Homing to mucosal lymphoid tissues

	Endothelium	Leukocyte
Adhesion molecule	MAdCAM-1	α4β7
Chemokine	CCL25	CCR9
	CCL28	CCR10

**Vedolizumab:** mAb against  $\alpha 4\beta7$ , used in inflammatory bowel diseases

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

#### Intestinal microbiome

10<sup>14</sup> cells (10x cells of the human body!)

Required for and regulate immunity of the intestine and also influence systemic immunity

Identification: 16S rRNA sequencing (specific for bacterial strains)

Extraintestinal consequences Rheumatoid arthritis Allergic diseases (asthma)

#### Example:

*Clostridium difficile* infection: usually caused by alteration of normal flora by antibiotic use Treatment: fecal transplantation (bacterial flora from healthy donors)

#### Other mucosal surfaces in the body

#### Features shared with the intestinal tract:

epithelial barrier, mucus and antimicrobial factors lymphoid tissues beneath the epithelium antigen sampling secretory IgA as prevention

#### Airways

Innate: surfactant protein; alveolar macrophages Adaptive: IgA, IgE (allergic reactions)

#### Genitourinary tract Innate: epithelial layer, DCs (Langerhans cells) Adaptive: IgG Relevance: STDs, HIV pathogenesis

#### Cutaneous immune system

2m<sup>2</sup> ~2x10<sup>10</sup> lymphocytes Physical barrier

Fig 14-9

(Sun)burns Microbes Traumas

Abbas, Lichtmann and Pillai. Cellular and Molecular Immunology. 8th edition. Copyright © 2015 by Saunders, an imprint of Elsevier, Inc

#### Cells of the cutaneous immune system

#### Keratinocytes

Physical barrier Cytokines: TNF, IL-1, IL-6, IL-18, IL-25, IL-33 (inflammation); IL-10 (regulation) Chemokines: CCL27 Growth factors: PDGF, FGF, GM-CSF Anti-microbial peptides: defensins, cathelicidins Activation: through PRRs (TLRs, NLRs)

#### **Dendritic cells, macrophages**

Mainly Langerhans cells

Migrate to regional lymph nodes following phagocytosis of antigens Present antigens to T cells, imprint skin-homing properties

#### T cells

Intraepidermal: mainly CD8<sup>+</sup> or  $\gamma\delta$  T cells Dermal: CD4<sup>+</sup> (T<sub>H</sub>1, T<sub>H</sub>2, T<sub>H</sub>17, T<sub>reg</sub>), mostly memory T cells

# Homing to the skin

	Endothelium	Leukocyte
Adhesion molecule	E-selectin	CLA
	CCL17	CCR4
Chemokines	CCL1	CCR8
	CCL27	CCR10
